OpenVZ

Install

```
# apt-get install hubzero-openvz-repo
# apt-get update
```

Then install

```
# apt-get install hubzero-openvz
```

Configure

```
# hzcms configure openvz --enable
```

If configuration is successful it should prompt you to reboot the server to activate the new kernel.

```
# reboot
```

Test

```
# vzlist
Container(s) not found
```

Or it will list the containers currently running if you check this on a running hub. The salient point being that the command doesn't issue any kind of error message.
