

# CMS

## Installation

```
# yum remove php
# yum install -y hubzero-cms-2.1.0
```

## Configuration

```
# hzcms install example
# hzcms update
```

## SSL Configuration

The default SSL certificate is meant for evaluation purposes only. For a production Hub, you will need to obtain a certificate from a provider. A certificate may contain two or three pieces: a public certificate, a private key, and sometimes an intermediate certificate.

Once you obtain the certificate, install their respective sub-directories in the **/etc/ssl** directory.

After the certificates are installed, you will need to modify the Apache configuration template located in **/etc/httpd/sites-m4/{hubname}-ssl.m4**.

**Replace SSLCERTFILE on line 184 with the path to your SSL certificate.**

```
SSLCertificateFile /etc/ssl/path/to/cert
```

**Replace SSLCERTKEYFILE on line 185 with the path to your SSL key.**

```
SSLCertificateKeyFile /etc/ssl/path/to/key
```

**If you have an intermediate certificate:**

```
remove line 186: ifdef(`SSLCERTCHAINFILE',`
remove line 188: `)dnl
```

Once the paths have been updated, reconfigure the CMS.

```
# hzcms reconfigure
```

If you are using the HTML5 VNC Proxy Server, [you must update your certificate settings as well.](#)
