

## 2.2.13

<https://github.com/hubzero/hubzero-cms/tree/2.2.13>

### Changes

- General bug fixes.
- Accessibility fixes.

### New Features

- Add publication cron job for FTP links. Embargoed publications need to be added/removed based on embargo date.
- Search Components previously only allowed indexable models to be added and show as a main type. Now custom queries can be provided as a main category.
- Add ability to re-send e-mail confirmation link. Administrators will see a re-send Confirmation E-mail button on the edit page of users that haven't confirmed their e-mail.
- Added module for displaying cookie policy (GDPR compliance).
- Administrator > Site Configuration: This will suggest a 4-character alpha-numeric "site code" based off the sitename if one isn't already provided.

### Developer Features

- Initial install migrations added to several modules that were missing them.
- Front-end of com\_content rewritten to remove remaining Joomla code.
- Course emails now use global email template.
- Start of refactoring extensions to remove inline CSS and Javascript. This allows for a potentially stricter Content Security Policy that better guards against Cross-Site Scripting attacks.
