

filexfer

Install filexfer

Install the filexfer package

```
# apt-get install hubzero-filexfer
```

Configure Apache for filexfer

Modify the hub site file at /etc/apache2/sites-available/hub-ssl

The apache hub site configuration files are not preconfigured to support this. Add the two highlighted lines as shown below. Note that the relative placement of these lines is important.

Edit **/etc/apache2/sites-available/hub-ssl**

```
<VirtualHost *:443>
    RewriteEngine on
    RewriteMap xlate prg:/usr/lib/mw/bin/filexfer-
xlate
    ...
    ...
    ...
    <Directory /www/myhub>
        Options FollowSymLinks
        AllowOverride None
        Order allow,deny
        Allow from all

        RewriteEngine On

    RewriteRule ^filexfer/(.*) ${xlate:$1|nothing} [P,QSA,L]
```

Then restart apache

```
# /etc/init.d/apache2 restart
```
