

filexfer

Install filexfer

Install the filexfer package

```
# apt-get install hubzero-filexfer
```

Configure Apache for filexfer

Modify the hub site file at `/etc/apache2/sites-available/hub-ssl`

The apache hub site configuration files are not preconfigured to support this. Add the two highlighted lines as shown below. Note that the relative placement of these lines is important.

Edit `/etc/apache2/sites-available/hub-ssl`

```
<VirtualHost *:443>
    RewriteEngine    on
    RewriteMap       xlate                    prg:/usr/lib/mw/bin/filexfer-
xlate
    ...
    ...
    ...
    <Directory /www/myhub>
        Options FollowSymLinks
        AllowOverride None
        Order allow,deny
        Allow from all

        RewriteEngine    On

RewriteRule    ^filexfer/(.*) ${xlate:$1|nothing} [P,QSA,L]
```

Then restart apache

```
# /etc/init.d/apache2 restart
```
