Mail

Install Exim

```
# yum install -y exim
```

To assist in testing the mail configuration

```
# yum install -y mailx
```

Configure Exim

So far it looks like the default config works. And exim comes with no command line utility for configuration like dpkg-reconfigure exim4-config like debian.

Test Exim

Use a real email address below so you can see if you get the email

```
# Mail -v someone@gmail.com
```
