

# telequotad

## Install

```
sudo yum install -y hubzero-telequotad
```

```
sudo service telequotad start  
sudo chkconfig telequotad on
```

## Configure

In order for filesystems quotas to work they must be enabled when they are mounted. Determine which filesystem contains your home directories and add "quota" to the mount option of the corresponding entry in the `/etc/fstab` file. Only the filesystem with `/home` on it matters to telequotad.

If quotas weren't already in affect, the run something like the following (depending on your filesystem configuration) to start up the quota system. The following example assumes you want to enable quotas at the root level

```
sudo mount -o remount /home  
sudo quotacheck -cugm /home  
sudo quotacheck -avugm  
sudo quotaon -u /home
```

## Test

```
sudo repquota -a
```

Should show disk usage for all users.
