

Launching tools with invoke scripts

Overview

Invoke scripts are small programs, usually written in sh or bash, used to setup the application container environment so the tool can run properly. More specifically, invoke scripts are responsible for:

- Locating tool.xml for Rappture applications
- Setting up the PATH and other optional environment variables
- Starting the window manager
- Starting optional subprograms, like filexfer
- Starting the application

For most applications, the invoke script is a single command that calls the default HUBzero invoke script, named `invoke_app`, with a few options set. In some rare situations, the tool needs the application container setup in a manner that `invoke_app` cannot handle. In these cases, the tool developer can modify the tool's invoke script to appropriately setup the application container.

The sections below list out details regarding the options of `invoke_app`, how to launch Rappture tools using an invoke script that calls `invoke_app`, and how to launch non-Rappture tools using an invoke script that calls `invoke_app`.

`invoke_app` and its options

HUBZero's default tool invocation script is called `invoke_app`. It is a bash script, usually located in `/usr/bin`. When called with no options, the script tries to automatically find the needed information to start the applications. There are a number of options that can be provided to alter the script's behavior.

`invoke_app` accepts the following options:

- A tool arguments
- c execute command in background
- C command to execute for starting the tool
- d working directory
- e environment variable (`${VERSION}` substituted with `$TOOL_VERSION`)
- f No FULLSCREEN
- S No submit
- n nanowhim version

LAUNCHING TOOLS WITH INVOKE SCRIPTS

-p add to path (`{VERSION}` substituted with `$TOOL_VERSION`)
-r rappture version
-t tool name
-T tool root directory
-u use environment packages
-w specify alternate window manager

Here is a detailed description of the options:

| | |
|----|---|
| -A | <p>Pass the provided enquoted arguments onto the tool.</p> <p>Example usage:</p> <pre>-A "-q blah1 -w blah2"</pre> <p>The options <code>-q</code> and <code>-w</code> are not parsed by <code>invoke_app</code>, but are passed on to the tool</p> |
| -c | <p>Commands to run in the background before the tool launches.</p> <p>Example usage:</p> <pre>-c "echo hi" -c "filexfer"</pre> <p>This prints "hi" to stdout and starts filexfer</p> |
| -C | <p>Command to execute for starting tool. Tool's command line arguments can be included in this option, or can be placed in the <code>-A</code> option.</p> <p>Example usage:</p> <p>Call a program, named <code>myprog</code>, located in the tool's bin directory:</p> <pre>-C @tool/bin/myprog</pre> <p>Call a program, named <code>myprog</code>, located in the tool's bin directory, with program arguments <code>"-e val1"</code> and <code>"-b val2"</code>:</p> |

```
-C "@tool/bin/myprog -e val1 -b val2"
```

Call a program, named myprog, located in the tool's bin directory with arguments -e val1 and -b val2, used in conjunction with invoke_app's -A option:

```
-C @tool/bin/myprog -A "-e val1 -b val2"
```

Call a program, named myprog, located in the tool's bin directory. We can omit the path of the program if it is an executable and located in the tool's bin directory because the tool's bin directory is added to the PATH environment variable. This would not work for calling a Perl script in a fashion similar to **perl myscript.pl** because in this case, **perl** is executable and **myscript.pl** is the argument.:

```
-C myprog
```

Call simsim with no arguments:

```
-C simsim
```

Call simsim with the options -tool and -values, to be parsed by simsim:

```
-C "simsim -tool driver.xml -values random"
```

Call simsim with the options -tool and -values, to be parsed by simsim:

LAUNCHING TOOLS WITH INVOKE SCRIPTS

| | |
|----|--|
| | <pre>-C simsim -A "--tool driver.xml -values random"</pre> |
| -d | Change to this working directory. By default change to session directory. |
| -e | <p>Set an environment variable.</p> <p>Example usage:</p> <pre>-e LD_LIBRARY_PATH=@tool/../../\${VERSION}/lib:\${LD_LIBRARY_PATH}</pre> <p>Within the value part of this option's argument, the text <code>\${VERSION}</code> is automatically substituted with the value of the variable <code>\${TOOL_VERSION}</code>. Similarly, the text <code>@tool</code> is substituted with the value of <code>\${TOOLDIR}</code>. By setting the environment variable, you are overwriting its previous value.</p> |
| -f | no full screen - disable FULLSCREEN environment variable, used by Rappture, to expand the window to the full available size of the screen. |
| -p | <p>Prepend to the PATH environment variable.</p> <p>Example usage:</p> <pre>-p @tool/../../\${VERSION}/bin</pre> <p>Within the value part of this option's argument, the text <code>\${VERSION}</code> is automatically substituted with the value of the variable <code>\${TOOL_VERSION}</code>. Similarly, the text <code>@tool</code> is substituted with the value of <code>\${TOOLDIR}</code>. By setting this option the PATH environment variable is adjusted, but not overwritten. The directory <code>@tool/bin</code> is automatically added to the PATH environment variable.</p> |
| -r | Sets <code>rappture_version</code> which dictates which version of Rappture is used. If left blank the version will default to the special keyword "system", which represents whichever version is pointed to by the default Rappture environment in "use". A "use -e -r rappture" will be performed to figure out where Rappture is |

LAUNCHING TOOLS WITH INVOKE SCRIPTS

| | |
|----|--|
| | <p>installed.</p> <p>If set to the special keyword "none", searching for Rappture executables (rappture, simsim, about) will be skipped and use of these executables will be disabled.</p> <p>This flag works well on hubs where multiple versions of rappture are installed. Users can specify their own version of Rappture to use by updating the PATH environment variable to include the directory where the "rappture" executable is installed.</p> |
| -S | <p>Disable submit client and run job locally. This flag takes no arguments and is used for debugging. It disables the use of submit client from the -C command that will be executed. The default behavior, when the flag is not given, is to run the command through the submit client unless the command is "rappture", "simsim", "getrappturexml", or "nanowhim", none of which are run through the submit client. Setting the flag on the command line will add your command to the list of commands that do not run with the submit client.</p> |
| -t | <p>sets <code>\${toolname}</code> which is used while setting up tool paths for <code>TOOLDIR</code> and <code>TOOLXML</code>. <code>\${toolname}</code> is the short name (or project name) of the tool. It is the same as the name used in the source code repository. With respect to the tool contribution process, it is the "toolname" in the path <code>/apps/toolname/version/rappture/tool.xml</code>. Setting this option will change the paths searched while trying to locate <code>tool.xml</code> and the <code>bin</code> directory.</p> |
| -T | <p>Tool root directory. This is the directory holding a checked out version of the code from the source code repository. It typically has the <code>src</code>, <code>bin</code>, <code>middleware</code>, <code>rappture</code>, <code>docs</code>, <code>data</code>, and <code>examples</code> directories underneath it. With respect to the tool contribution process, it is the <code>/apps/toolname/version</code> in the path <code>/apps/toolname/version/rappture/tool.xml</code>. Setting this option will change the paths searched while trying to locate <code>tool.xml</code> and the</p> |

LAUNCHING TOOLS WITH INVOKE SCRIPTS

| | |
|-----------------|---|
| | <p>bin directory. Typically when testing this option is used to specify where the tool directory is. In this case, its the present working directory:</p> <pre>-T \$PWD</pre> |
| <code>-u</code> | <p>Set use scripts to invoke before running the tool.</p> <p>Example usage:</p> <pre>-u octave-3.2.4 -u petsc-3.1-real-gnu</pre> <p>These would setup octave-3.2.4 and petsc-3.1 in the environment that your tool would launch in.</p> |
| <code>-w</code> | <p>Set the window manager. The default value is to use the ratpoison window manager if it exists. If ratpoison is not installed on the system, look for the icewm captive window manager setup. Use this flag to choose an alternative window manager. If your application does not require a window manager specify headless. The possible options are headless, ratpoison, captive, and icewm. If multiple options are specified the first one listed is selected.</p> <p>Examples:</p> <p>Use the icewm captive window manager.</p> <pre>-w captive</pre> <p>Use no window manager.</p> <pre>-w headless</pre> |

`invoke_app` is called from within a tool's invoke script. The invoke script is stored in the middleware directory of the tool's source code repository.

Using `invoke_app` with Rappture tools

Invoke scripts should be placed in the middleware directory of the tool's source code repository. A typical invoke script for a Rappture application looks similar to this:

```
#!/bin/sh

/usr/bin/invoke_app "$@" -t calc \
                    -C rappture
```

In the invoke script above, `invoke_app`, located in the directory `/usr/bin`, is called with `"$@"`, `"-t calc"`, and `"-C rappture"`. `"$@"` represents all options that the invoke script itself received. `"-t calc"` tells `invoke_app` that the toolname is "calc". `"-C rappture"` tell `invoke_app` to execute the rappture command. This information is used by `invoke_app` to figure out which tool it is supposed to be launching and where that tool is installed.

For most Rappture applications, the invoke script is very simple. The above is enough for `invoke_app` to start looking for a `tool.xml` file. `invoke_app` looks for the file named `tool.xml`. It uses the `TOOLDIR` variable to help decide where to look. If the `tool.xml` file is not found in the `${TOOLDIR}/rappture` directory, `invoke_app` will exit explaining that it could not find the `tool.xml` file. The `TOOLDIR` variable can be set from the command line using the `-T` flag:

```
/usr/bin/invoke_app "$@" -t calc \
                    -C rappture \
                    -T ${PWD}
```

Actually, it is more common to see the `-T` flag provided to a tool's invoke script, and the option is forwarded to `invoke_app` by `"$@"`:

```
./middleware/invoke -T ${PWD}
```

In the above example, the `TOOLDIR` variable is set to the present working directory, which is stored in the variable `PWD`. Specifying the `-T` option is usually not needed, but can help when `invoke_app` is confused on what it is supposed to be launching.

Using `invoke_app` with Jupyter Notebook tools

LAUNCHING TOOLS WITH INVOKE SCRIPTS

Invoke scripts should be placed in the middleware directory of the tool's source code repository. A typical invoke script for a Jupyter Notebook application looks similar to this:

```
#!/bin/sh

/usr/bin/invoke_app "$@" -t calc \
                        -C "start_jupyter -t -A -T @tool/bin calc.ipynb" \
                        -u anaconda-7 \
                        -r none \
                        -w headless
```

In the invoke script above, `invoke_app`, located in the directory `/usr/bin`, is called with `"$@"`, `"-t calc"`, `"-C start_jupyter ..."`, `"-c filexfer"`, `"-w captive"`. `"$@"` represents all options that the invoke script itself received. `"-t calc"` tells `invoke_app` that the toolname is "calc". This information is used by `invoke_app` to figure out which tool it is supposed to be launching and where that tool is installed. `"-C start_jupyter ..."` tells `invoke_app` that the command to run to start the tool is "start_jupyter". "start_jupyter" has several typical arguments as shown. `"-r none"` tells `invoke_app` that Rapture is not required. `"-w headless"` tells `invoke_app` not to start a window manager.

Using `invoke_app` with GUI tools

Invoke scripts should be placed in the middleware directory of the tool's source code repository. A typical invoke script for a non-Rapture GUI application looks similar to this:

```
#!/bin/sh

/usr/bin/invoke_app "$@" -t calc \
                        -C calc \
                        -c filexfer \
                        -w captive
```

In the invoke script above, `invoke_app`, located in the directory `/usr/bin`, is called with `"$@"`, `"-t calc"`, `"-C calc"`, `"-c filexfer"`, `"-w captive"`. `"$@"` represents all options that the invoke script itself received. `"-t calc"` tells `invoke_app` that the toolname is "calc". This information is used by `invoke_app` to figure out which tool it is supposed to be launching and where that tool is

LAUNCHING TOOLS WITH INVOKE SCRIPTS

installed. "-C calc" tells `invoke_app` that the command to run to start the tool is "calc". In this case calc is UI program built using something other than Rappture. Possible GUI builders include but are not limited to PyQt and MATLAB. "-c filexfer" tells `invoke_app` to start up the filexfer program before starting the tool's graphical user interface. "-w captive" tells `invoke_app` to use the icewm captive window manager. For non-rappture applications the icewm captive window manager may be preferred over the ratpoison window manager if there are multiple graphical user interface windows that could popup.

The invoke script above could be made more svelte if the we did not want to start filexfer and we wanted to use the ratpoison window manager. After all, not all applications require files from the user, so they don't need the filexfer program. Here's an example of the tool named calc (the "-t calc" option), that is started by the executable named calc (the "-C calc" option), and uses the default window manager which is ratpoison.

```
#!/bin/sh

/usr/bin/invoke_app "$@" -t calc \
                    -C calc
```

Other invoke script examples

Here are a few common invoke scripts examples that demonstrate using `invoke_app` options.

Use the -u option to setup Octave-3.2.4 in the path before starting the tool's graphical user interface. The -u option sources a "use" script (octave-3.2.4 in this example) from the `/apps/environ` directory.

```
#!/bin/sh

/usr/bin/invoke_app "$@" -t calc \
                    -C calc \
                    -u octave-3.2.4
```

Use the -A option to send additional arguments to the command to be executed:

```
#!/bin/sh

/usr/bin/invoke_app "$@" -t calc \
                    -C calc \
```

LAUNCHING TOOLS WITH INVOKE SCRIPTS

```
-A "-value 13 -value 5 -op add"
```

Or:

```
#!/bin/sh
```

```
/usr/bin/invoke_app "$@" -t calc \  
                        -C "calc -value 13 -value 5 -op add"
```

Launching a Matlab tool (named app-fermi) with a Rappture graphical user interface:

```
#!/bin/sh
```

```
/usr/bin/invoke_app "$@" -t app-fermi \  
                        -C rappture
```

Launching a Python tool (named app-fermi) with a Rappture graphical user interface:

```
#!/bin/sh
```

```
/usr/bin/invoke_app "$@" -t app-fermi \  
                        -C rappture
```

Launching a Java tool (named app-fermi) with a Rappture graphical user interface:

```
#!/bin/sh
```

```
/usr/bin/invoke_app "$@" -t app-fermi \  
                        -C rappture
```
