- [2.2.19](#)
- [2.2.20](#)

2.3

- [PHP 7](#) minimum requirement
- Prefixed component com_ and module mod_ directories are deprecated.
- HUBzero modules: {module name}.php and helper.php files merged
- Modules must extend HubzeroModuleModule
- Final removal of all remaining Joomla libraries.
- Extension (com, mod, plg, tpl) manifests changed from XML to JSON (e.g. composer.json).
- Removal of /api and /administrator directories. Routing to appropriate client (https://{hub}/api and https://{hub}/administrator) is mapped by the CMS to URL segment rather than actual directories on the machine.

Active Development/Investigation (release target not set)

- Replace OpenVZ with Docker for tool containers.
- Docker-based hub install.
- Integration with [Agave](#).
- Default language is en-US, changed from en-GB.
- Stop tracking /app directory entirely. The CMS will auto-create the directory (and sub-

directories) as well as populate any necessary files.
- Nothing is served directly out of /core
    - Static assets (CSS, JS, etc) are served from a single location such as /app/public.
